## **Arthur D Little**

April 2020

### Impact of COVID-19 on the Oil & Gas Sector

#### Agenda

- I Executive Summary
- 2 Industry Structure Impact
- 3 Impact & Mitigation per Segment

#### Arthur D Little 2

#### Agenda

#### I Executive Summary

- 2 Industry Structure Impact
- 3 Impact & Mitigation per Segment

#### Arthur D Little 3

# COVID-19 will accelerate the Oil & Gas industry's transformation journey with oversupply and low prices expected to last for years

Oversupply and Low Price Impact on Oil & Gas Sector

#### OPEC vs Shale War + COVID-19

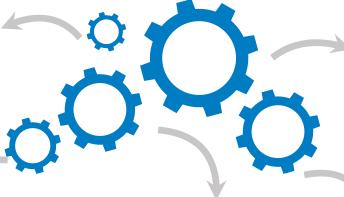

- Russia/Saudi Arabia battle has the US as an implicit party
- COVID-19 demand crisis deepens oversupply and exaggerates the drop in crude prices
- The national budgets of OPEC countries, and Russia, are under severe challenge at low oil prices

#### Massive Cancellation of Projects

- Investments shrink because of economics and funding constraints
- Operational shutdown of some high-cost oil
- Major capital projects cancelled or delayed

#### More Vulnerable Refineries

- Low utilization rates lie ahead
- Low/negative margins will accelerate expected shutdowns
- No CAPEX/financing available for quality/ conversion upgrades or greenfield projects to adjust the product balance demanded

#### Asset Portfolio Restructuring

- Many asset classes become less attractive for oil companies, leading to extensive restructuring
- Active transaction markets with many distressed assets becoming available on the market

#### **Energy Transition**

- World leaders have already decided to go "greener" (COP-21)
- Governments will be critical to transition continuity and continuing support
- Majors likely to continue their own energy transition as some renewable projects will show better economics than many E&P developments
- Cheap oil may slow the trend to renewables

#### Industry Concentration

- Limited budget for reserves addition
- OPEC gains market share power from IOCs
- Efficiency gains will be achieved during crisis and after consolidation

#### Arthur D Little

Source: Arthur D. Little

#### **Executive Summary**

#### The oil price war, together with COVID-19, has created a perfect storm generating a highly negative short term impact for the industry Status

Production	<ul> <li>No agreement quotas</li> <li>Saudi Arabia so Russian and ha</li> </ul>
Demand	<ul> <li>Strong immed</li> <li>Short to medi</li> <li>World was alr reduction for</li> </ul>
Prices & Margins	<ul> <li>Strong drop in</li> <li>Refining margi regions</li> </ul>
Supply Chain Disruptions	<ul> <li>No storage fo shut-in of som</li> <li>Financing issue budget concert</li> </ul>

- t for reducing OPEC production
- ees over-supply as a way to limit alt US shale production
- liate impact of isolation measures
- ium term impact from recession
- ready claiming for an oil CO<sub>2</sub> targets
- crude oil price
- ins low, even negative in some
- or upcoming production, with e crude oil production
- es along the full value chain and rns for some oil producers

#### Short Term Impact

- Some immediate crude production shutdowns in Nth America
- Fracking activity may come to an almost a complete halt and a majority of deep-water projects may be cancelled
- >30% drop of flights, light vehicle transit close to zero in many regions
- 5-10 MMBD annual average demand drop depending on how long COVID impact lasts
- Would take years to recover 2019 levels, with part of demand recovery going to other energies
- Some operations cannot cover production cash costs
- Refining shutdowns and/or do not start after turnarounds
- Pessimistic outlook for any CAPEX program
- Financial disruptions along full value chain. Many high leveraged US independents will not survive
- Oil Field Services strongly impacted by low activity levels and producers cash constraints

#### **Executive Summary**

All industry segments are impacted by the volume and price drops, the resulting financial collapses and related supply chain/operational disruptions

	Field Operations	Oil Field Services	Refining	Transport & Distribution
Est. size of impact (illustrative)	A THE			
Supply chain	<ul> <li>Storage restrictions for oversupply</li> </ul>	<ul> <li>Spare part access will be critical, especially from China</li> <li>Drill bits / tools limited impact given low activities for new wells / exploration</li> </ul>	<ul> <li>Already contracted crude needs to be re-sold</li> <li>Storage restrictions for crude, intermediate and final products</li> </ul>	<ul> <li>Some production halt because of lack of storage downstream</li> </ul>
Operations	<ul> <li>Manpower at minimum possible level</li> <li>Operators to prioritize low- cost assets</li> </ul>	<ul> <li>Exploration / appraisal / new wells will halt</li> <li>Well intervention/workover to remain steady especially for rig-less activities</li> </ul>	<ul> <li>Limited to minimum staff</li> <li>CAPEX initiatives and turnaround stopped</li> <li>Daily vs. monthly optimization</li> </ul>	<ul> <li>Limited to minimum staff</li> <li>CAPEX initiatives reduced or stopped</li> </ul>
Price/Margin	<ul> <li>Some production assets cannot cover cash costs</li> <li>Negative economics for some shale, deepwater and Canadian operations</li> </ul>	<ul> <li>Many contracts will be renegotiated /cancelled</li> <li>Little room for additional efficiency gains</li> </ul>	<ul> <li>Low utilization rates drive low to negative margins for some locations and configurations</li> </ul>	<ul> <li>Lower revenues because of volume drop</li> <li>Financial stress for retail dealers requires support</li> </ul>
Customers (incl. demand)	<ul> <li>High level of oversupply</li> <li>Penalization for non-standard crudes</li> </ul>	<ul> <li>Demand will reduce until operators stabilize strategy</li> <li>Brownfield activities will be dominant</li> </ul>	<ul> <li>Demand decrease under minimum production level for some refineries</li> <li>Demand mix change towards heavier fuels</li> </ul>	<ul> <li>Demand decrease until isolation ends and economy recovers</li> </ul>

Critical impact High negative impact

Moderate negative impact Low negative impact

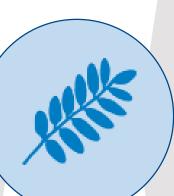

6

The crisis will severely impact the oil industry, accelerating its transition to renewables, already underway, and altering its climate change approach

Transition to renewables would accelerate

- But oil projects now have lower returns, and higher uncertainty than before
- Renewables have lower technical risks and now potentially lower commercial risk and higher return rates than oil Source: Arthur D. Little

- Fossil fuels may be more competitive
- Cheap oil would change customer feeling about "going greener"
- Power generation prices already lower, partly due to lower fossil fuel prices
- Higher renewable subsidies will be required to reach customer breakeven
- Governments would give priority to economy recovery support after recession (i.e. reducing EV rebates)
- US & Canada would support oil industry from collapse

Immediate and lasting impacts on the industry are likely to drive a structural transformation, leaving fewer, smaller players after the crisis

Who would be the survivors of current crisis?

Low prices/margins will last for years Production and refining shutdowns in many areas Financial collapse already underway for some companies Asset sales and consolidation by small and large companies Ongoing major projects no longer profitable Cost of capital for fossil fuel projects to increase even further

#### **Transform and survive**

- Low cost /XL NOCs
- Super Majors able to transform
- Global oil field service companies
- Some niche players/regional "Mini Majors"

#### Shrink/collapse or acquired

- NOCs with high cost/low reserve base
- Shale focus producers

. . . . . .

- Small scale independent refiners
- Heavy oil/Canadian tar sands players

Some new business models would emerge and success in the new industry ecosystem

Source: Arthur D. Little

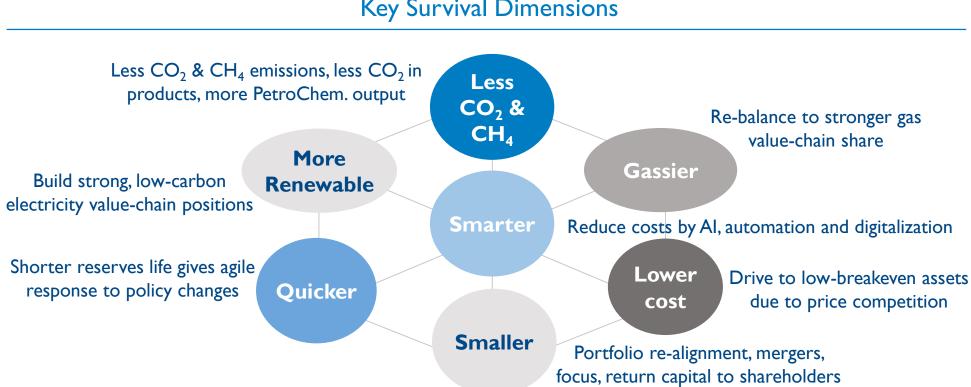

```
Arthur D Little 🔹
```

There is still a chance for the market to get "back to normal" sooner than expected, but it is likely that the oil industry will continue to lose appeal

Scenario	Industry Outlook	
	Larger market share concentrated in few OPEC countries	
	Majors transform to survive	
"Stagnation"	Many production and refining shutdowns. Major projects cancelled as defined pre-COVID	
<ul> <li>Oversupply lasts 2+ years</li> <li>"L-Shape" demand pattern, and persistence of</li> </ul>	Significant downsizing of fracking activities	
high inventory levels <ul> <li>Crude price below \$40/Bbl</li> <li>Low refining utilization rates and margins</li> </ul>	International Oil Companies accelerate energy transition and new business models emerge	
	2020 industry financial impact will collapse some high cost producers	
	Companies with already diversified portfolios will have lower impact and capitalize on market bounce	
<ul><li><b>"Back to Normal"</b></li><li>• Saudi Arabia/Russia agreement at OPEC</li></ul>	Major capital projects will be delayed and executed later considering higher risk and lower price forecast	
<ul> <li>Oversupply balanced</li> <li>"V-Shape" demand bounce/market rebalance</li> <li>Crude @\$50/Bbl at Q4 2020</li> </ul>	International Oil Companies will focus on healthier project portfolios and efficiency gains	

#### Arthur D Little

Under any scenario, lower expected returns, climate and  $CO_2$  challenges will drive companies to search for new pathways to survive

Key Survival Dimensions

#### Arthur D Little

#### Agenda

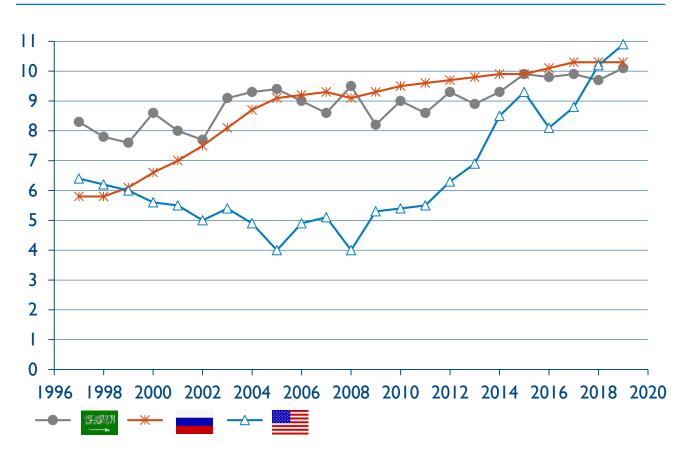

#### **Executive Summary**

- 2 Industry Structure Impact
- 3 Impact & Mitigation per Segment

# Saudi Arabia see oversupply as a way to limit Russian supply influence and halt US shale production growth

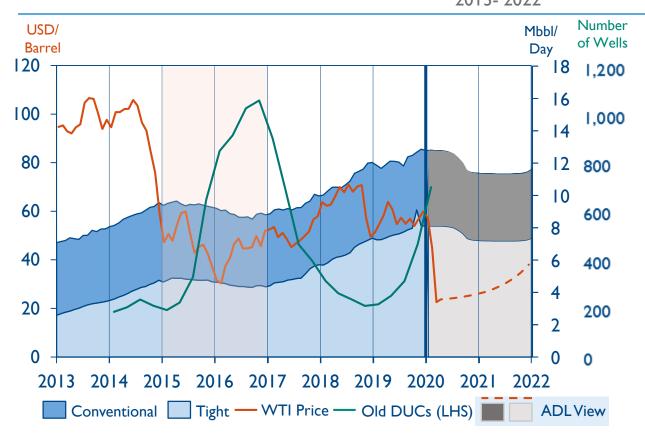

US-Russia-KSA production of crude oil MMBD, 1998-2019

- US became the top oil producer taking advantage of technology evolution after a period of high crude prices
- Russia-Saudi Arabia supply quota and price battle has created an oversupply
- Small imbalances in crude oil supply cause high price reactions
- US players (and others in the world) are not be able to maintain current production level at current crude prices

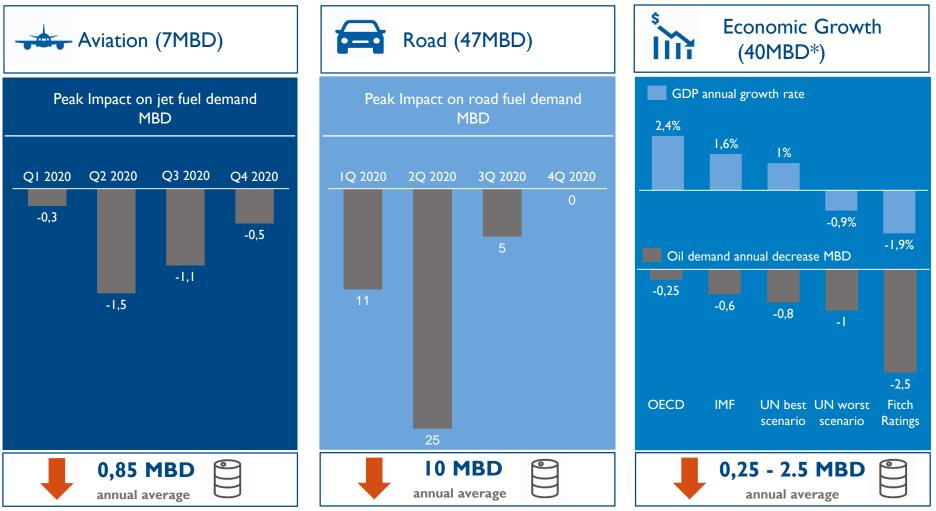

# As in the 2014-16 oil crisis, US production will be strongly impacted and will not recover at our expected price-track of less than \$40/bbl

US Hydrocarbon Production, WTI Prices & old DUC Inventory 2013-2022

- Unconventional hydrocarbons production has tight economics and reacts rapidly to price reductions
- Some producers have their prices hedged for some months into the future, but would not be able to maintain production at any lower than \$40/Bbl
- Localized US demand reductions also limit production due to logistics restrictions

Demand forecasts change every week, but average global reductions of more than 10 MBD are expected for 2020

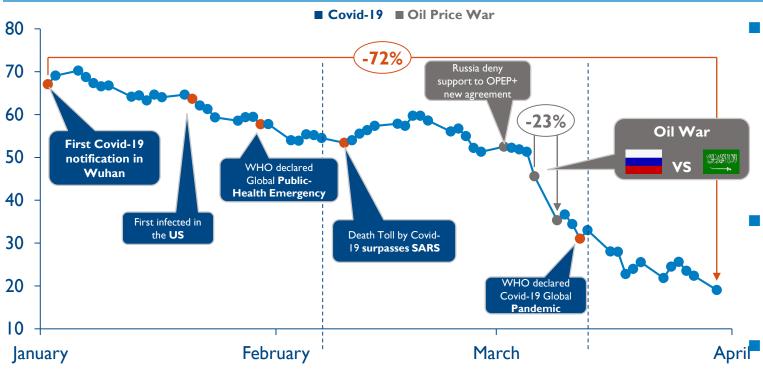

Source: Arthur D. Little; IATA; OECD; IMF; UN; Fitch Ratings; Rystad; Goldman Sachs.

<sup>\*</sup>Oil demand for non-transport activities

Oil prices have been affected by the Russia/Saudi Arabia disagreement, the outbreak of the global pandemic and the resulting increased oversupply

Brent Spot Price Dollars per Barrel (from Jan 2, 2020 to March 30, 2020)

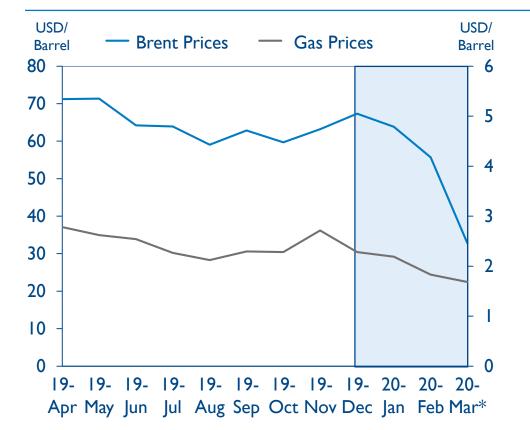

Russia did not accept Saudi Arabia production decrease proposal after negative forecast from EIA for global demand because of COVID-19 and Saudi Arabia stated it would increase its exports

- The global pandemic, declared by WHO increased crude oil oversupply and impacted prices still further
  - OPEC would soon decide soon cut production after over 70% price drop

Low prices support Saudi Arabia's intention of increasing its market share but they would ultimately accept a production cut in order to support oil prices sufficient to balance its national budget

Natural gas prices have also dropped significantly, with the LNG sector being greatly impacted, reducing its expected growth in the coming years

Monthly Brent vs Natural Gas Henry Hub (HH) Price

- Economic crisis impacted on industrial demand for gas and gas-fired power globally
- Henry Hub prices are now below \$2/MMBTU and JKM futures prices are below \$3/MMBTU
- LNG liquefaction already has excess capacity, with oversupply and depressed prices, even before COVID-19
- Major capex cuts and the deferral of several multi-billion dollar LNG projects (i.e. Australian) are already announced. Shell for example is walking away from the Lake Charles gas export project.

Crude oil oversupply has created an economic storm for the oil industry, with prices and margins in their lowest level this century

Oil Sector Supply vs. Demand Unbalance

#### Supply

- Additional Saudi production would flood the market
- Some immediate shutdowns, but some production will take more than a year to fall off-stream, including by natural decline
- Storage capacity is filling and already contracted crude is re sold to the market

# Demand Impact of over 10 MMBD, or about 10% of global consumption Demand mix changes challenges the use of refining capacity and configuration Even when isolation ends, recession will continue impacting fuel demand

Arthur D L

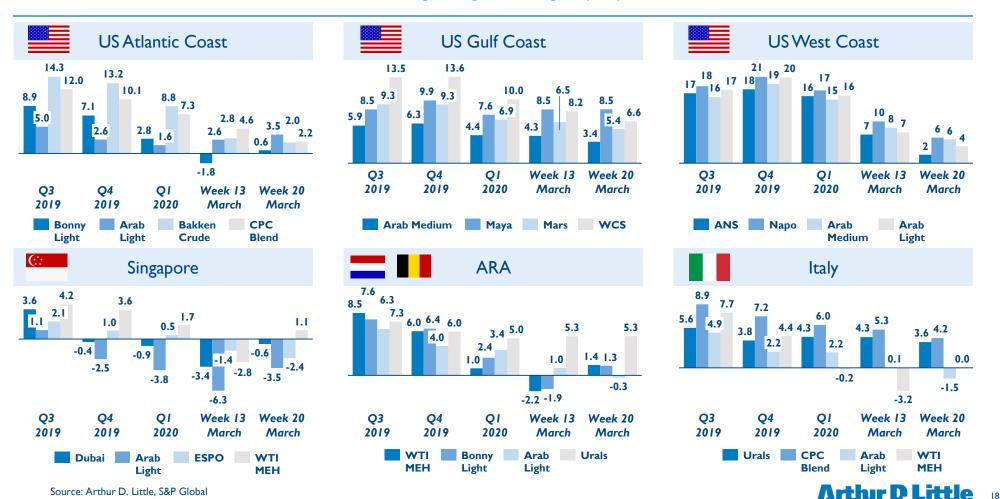

Crude prices below \$30/Bbl now and are expected to remain below \$40/Bbl for >2 years

- Tight refining margins, at least until 2019 fuel demand is restored
- Immediate financial crisis or collapse for many players; with widespread consolidation and portfolio reshaping
- Much new CAPEX projects and most exploration either cancelled or delayed
- <u>Supply chain disruptions</u>

Note: QI 2020 (January I to March20)

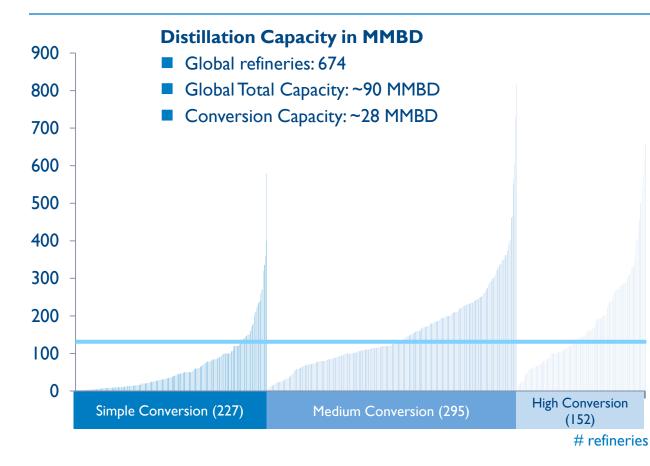

Global refining margins took a severe hit, mainly on falling gasoline and jet fuel demand, due to progressive lockdowns in multiple countries

#### Refining Margin Averages (\$/b)

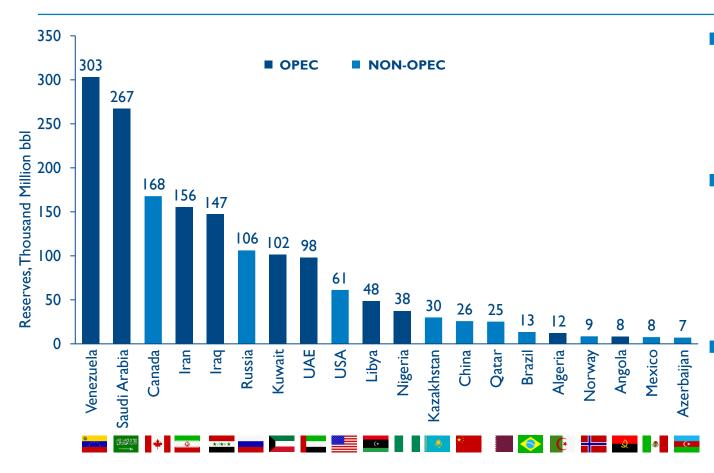

Demand decrease, and a strong decline in refining margins that will not recover soon, will accelerate an ongoing restructuring in global refining

#### **Global Oil Refineries**

- The global refining asset base was already under transformation, with large scale high complexity additions in Middle East and Asia displacing small low conversion capacity elsewhere
- The current drop in margins has already forced shutdowns, with some plants being unable to cover their cash operating costs
- Revamps, turnarounds and capital projects have been cancelled in many units
- Restructuring of the refining sector will accelerate since strong margins will not return until 2019 demand levels have been recovered

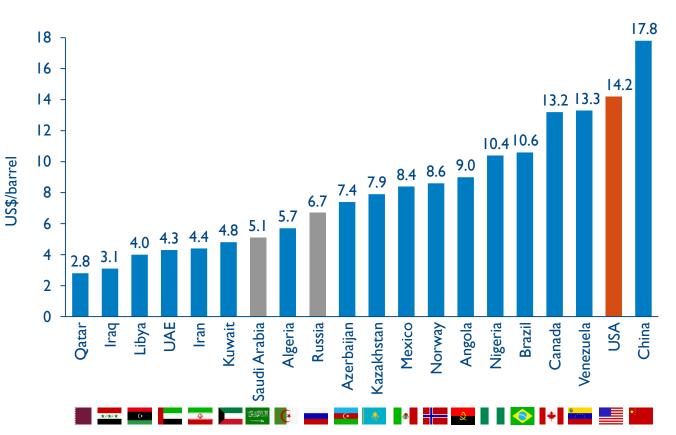

We expect OPEC to gain more power, relative to the IOCs, as oil supply becomes more concentrated in a few low cost producing countries

Reserves By Country (Thousand MMBbls)

- In a low oil-price scenario funding commitments by the IOCs for finding and developing new reserves will decrease sharply
- With an average reserve life of about 10 years, top IOCs reserves position will progressively shrink and their share of total oil production (and power) will reduce
- OPEC's reserves life of above 50 years, combined with their generally low production costs will ultimately displace much IOC market access

Current prices and oil production costs favor OPEC's ability to increase market share, but challenge their national budgets and political stability

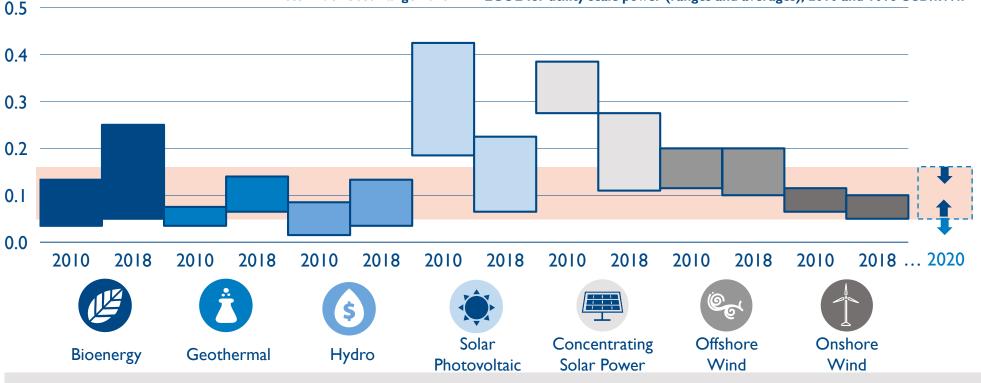

#### Oil Production Cost By Country \$/Bbl

- Much of OPEC's generally very large reserves volumes could be produced at only very low cost
- But, current oil prices are too low for petroleum based economies to support their national social and economic programs. This places their political stability at risk
- Nevertheless, there are also significant reserves volumes, outside OPEC, that will not be able to maintain their current production levels at prices below \$40/bbl, reducing this oversupply pressure

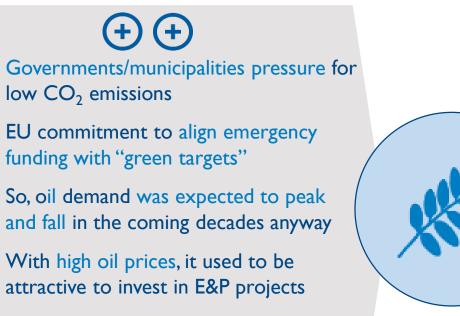

A global commitment to a "green economy" has been underway, driven by declining renewables costs, but lower fossil fuel prices may challenge this

Competitiveness of Renewables vs Fossil Fuels 2018 Fossil Fuel Cost Range 2018 LCOE for utility scale power (ranges and averages), 2010 and 1018 USD/kWh\*

Lower fossil fuel prices, combined with lower demand for power and lower power prices, industrial and transportation traditional energy sources cost, defines a lower cost competition for renewables penetration The crisis will severely impact the oil industry, accelerating its transition to renewables, already underway, and altering its climate change approach

Transition to renewables would accelerate

- But oil projects now have lower returns, and higher uncertainty than before
- Renewables have lower technical risks and now potentially lower commercial risk and higher return rates than oil Source: Arthur D. Little

Fossil fuels may be more competitive

Power generation prices already lower,

required to reach customer breakeven

partly due to lower fossil fuel prices

Higher renewable subsidies will be

Governments would give priority to

recession (i.e. reducing EV rebates)

economy recovery support after

US & Canada would support oil

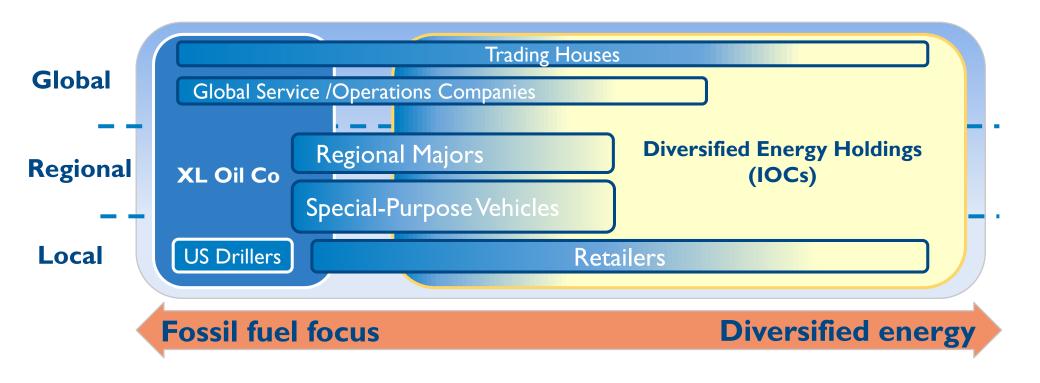

industry from collapse

Cheap oil would change customer

feeling about "going greener"

The oil & gas industry will accelerate its transition to a cleaner and more diversified portfolio of energy sources, products and service offerings

Potential ecosystem for future oil companies

Arthur D Little

Immediate and lasting impacts on the industry are likely to drive a structural transformation, leaving fewer, smaller players after the crisis

Who would be the survivors of current crisis?

Low prices/margins will last for years Production and refining shutdowns in many areas Financial collapse already underway for some companies Asset sales and consolidation by small and large companies Ongoing major projects no longer profitable Cost of capital for fossil fuel projects to increase even further

#### **Transform and survive**

- Low cost /XL NOCs
- Super Majors able to transform
- Global oil field service companies
- Some niche players/regional "Mini Majors"

#### Shrink/collapse or acquired

- NOCs with high cost/low reserve base
- Shale focus producers

. . . . . .

- Small scale independent refiners
- Heavy oil/Canadian tar sands players

Arthır D Litti

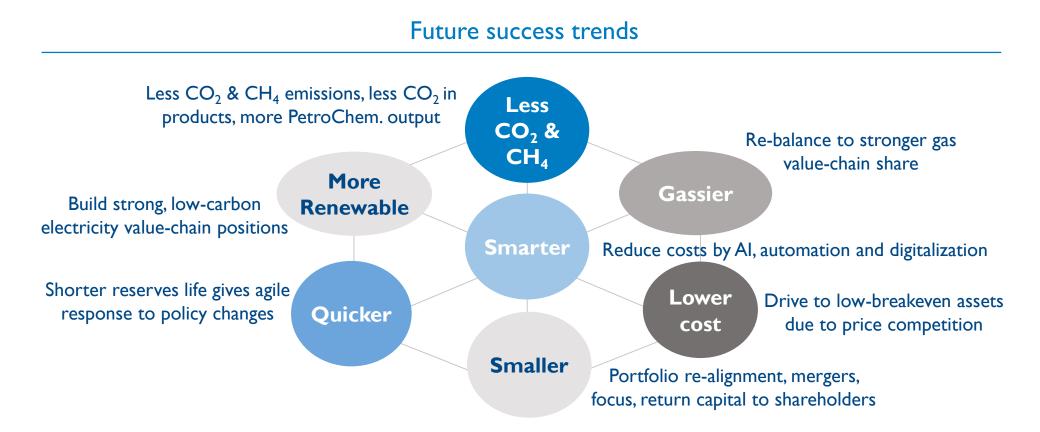

Some new business models would emerge and success in the new industry ecosystem

There is still a chance for the market to get "back to normal" sooner than expected, but it is likely that the oil industry will continue to lose appeal

Scenario	Industry Outlook	
	Larger market share concentrated in few OPEC countries

Field operations face a drastic change on their economics and requires reengineering of exploration and production plans and investments

Field Operations Potential threats		Mitigation actions
I	Downstream storage restrictions	<ul> <li>Look for long term capacity contract if low cost production</li> <li>Swap crude and/or storage among different locations</li> </ul>
2	Potential staff limitations	<ul> <li>Consolidate current and future shutdowns for 2020 and optimize plans</li> <li>Review and prioritize operating assets, new developments, and production enhancement programs</li> <li>Reduce and optimize operational runtime to a minimal in certain assets to avoid unplanned shutdowns, and manage manpower limitations</li> </ul>
3	Tight or negative economics for some assets	<ul> <li>Close monitor of point forward cash flow and economics by field/asset/project</li> <li>Take advantage of available equipment and/or suppliers to be prepared to produce as soon as crude price is back above break-even level</li> <li>Develop fast recovery programs to immediate commence operations – monitor and establish trigger points</li> </ul>
4	Oversupply Crude traveling far	<ul> <li>Be commercially proactive and flexible when looking for new production outlets</li> </ul>

#### OFS players in Exploration / Greenfield developments will be most impacted while producing assets may continue but at a minimal / optimal

#### **Oil Field Services Mitigation actions Potential threats** Consider flexibility in contract guarantee of work (such as contract expiry extension) if price **Contract renegotiations /** negotiations are being sought by Operators cancellations Consider accelerate price normalization once the situation returns to stabilization Conduct full asset rationalization and prioritization across all operated regions • Establish asset-readiness programs to ensure immediate deployment once market stabilizes 2 Low utilised assets • Collaborate with other OFS players to sub-contract work to maintain high utilization of assets and manpower Monitor potential M&A opportunities Consolidation / M&A Develop recovery plans to include grow and diversify using inorganic strategies 3 activities Conducting an asset rationalization assessment will provide full transparency on sparing **Delayed spare parts to** philosophy 4 maintain operations Establish local 'pooling' of assets and services with other OFS players to optimize OPEX

Refineries need to do frequent re programing, isolation of shifts, operate at minimum staff levels and cancel non critical CAPEX initiatives

Refining Segment Potential threats		Mitigation actions
I	Storage restrictions	<ul> <li>Contracted feedstock/crude re sale or contract re negotiation</li> <li>High frequency of operations optimization and re scheduling</li> </ul>
2	CAPEX initiatives and turnaround stopped	<ul> <li>Minimize number of staff entering refineries and depots</li> <li>Delay non critical CAPEX initiatives</li> <li>Stop or delay and reschedule turnarounds</li> </ul>
3	Low utilization rates drive low to negative margins	<ul> <li>Close monitor of marginal economics of process unit to avoid hidden suboptimal production</li> <li>Run at minimum operational rate as son as does not compensate to shutdown plant</li> <li>Assess buy-import vs. maintain refinery running</li> <li>Continue with operational efficiency initiatives as soon as quarantine period ends</li> </ul>
4	Demand decrease and mix change	<ul> <li>Close monitor marginal economics and evaluating shutdowns of light products units</li> <li>Assess buy-import vs. high processing rates</li> <li>Look after markets for intermediate products (i.e. naphtha) to maintain refinery running</li> </ul>

Transport and distribution segment faces logistics disruptions and financial restrictions that will need support from refiners/integrated companies

Transport & Distribution Potential threats		Mitigation actions
I	Lack of storage downstream	<ul> <li>More frequent and strict pipeline capacity planning, shipping only crude with a secure outlet</li> <li>Benefit by open access to own available storage</li> <li>Swap storage among geographies with trading and midstream companies</li> <li>Assess use of floating storage</li> </ul>
2	Limited to minimum staff	<ul> <li>Work with isolated shifts and minimum staff levels</li> <li>Avoid delayable contractors intervention to facilities</li> <li>Cancel non critical CAPEX initiatives</li> </ul>
3	Lower revenues because of volume drop	<ul> <li>Offer flexible payment conditions to retail stations dealers</li> <li>Consider flexibilization take or pay contracts considering force majeure conditions</li> <li>Extend timing for product delivery of a contract (i.e. delivering total amount when market conditions improve)</li> </ul>
4	Demand decrease	<ul> <li>Re negotiate contracted freight/trucks</li> <li>Re assess key client portfolio for future expected market conditions</li> <li>Re assess channel strategy for B2B customers</li> </ul>
